Supporting Hammersmith Hospital's mains upgrade

Specialist power support was provided during essential mains upgrade works at Hammersmith Hospital. The hospital is a major teaching hospital located in White City, west London and part of the Imperial College Healthcare NHS Trust.

We supplied 2 x 1250kVA synchronised standby generators with remotely monitored fuel tanks and a 400v to 11kV step up transformer to provide backup power during the works, as well as full installation and commissioning of equipment.

The use of remotely monitored fuel tanks enabled the fuel levels to be continually monitored throughout the project, giving the customer complete peace of mind and enabling real to time visibility of performance.
