

Power resilience for a Tier III data centre

Power disruption was not an option for this client's Tier III data centre and colocation facility near London.

Woodlands supplied a pair of 2000kVA generators on a standby basis to support the client's 2N redundancy requirements on site. Craneage was also provided to position the generators on site as HGV access was limited.

With full integral fuel tanks and a high level of acoustic treatment within the container, the generators provided a very quiet package with minimal footprint.

Throughout the whole hire period, the generators were monitored by our remote telematics software to ensure full uptime was maintained.

LOCATION: SOUTH EAST, UK. TYPE OF PROJECT: PRODUCT HIRE. SECTOR: DATA CENTRE
